Scenario:

You go pick up your girlfriend to get something to eat. You ask her what she wants, but she hits you with the usual "It doesn't matter." You keep giving suggestions but she denies you on all of them. I guess it does matter. You would like to find a random place using your phone.

Task 1: Search for a restaurant with inside seating using your location and get the results. Get directions to the first option.

Task 2: You loved that restaurant, so you want to save it for future reference. Name it "Our favorite."

Task 3: Now you want to look up an ice cream spot. You notice the results are too far, so go back and set it to within 10 miles. Then get your results.

Notes:

What changes should I make?
1. Make it easier to go back to preferences from the result screen.
2. Make it more obvious to get directions for your results.
3. Add an option where you can type/ search for the type of food place you want.

What things should I keep?
1. The "using your location" option was easy to find.
2. The organization of the results.
3. The preferences screen was easy to navigate to what was needed.
